• **MODBUS:** Software library to send/receive data according to the Modbus protocol. This library is written in C and supports RTU (serial) and TCP (Ethernet) communications.

• **Watchdog:** Features a hardware function to trigger system reset in a user specified time interval (Linux standard API).

Cybersecurity:

• **Secure Boot:** A novel authentication algorithm proposed to secure platform integration. Only trusted Linux kernel and bootloader should be executed (Patent Pending).

• **SUDO Mechanism:** Sudo (sometimes considered short for Super-user Do) is a program designed to let system administrators allow some users to execute some commands as root (or another user). The basic philosophy is to give as few privileges as possible but still allow people to get their work done, and the Root account is disabled by default.

• **Security Update of existing software packages:** All packages in the UC-8100 could be updated for security purposes via Debian or Moxa's Advanced Packaging Tool (APT) server.

• **USB Protection:** Provides a mechanism for disabling USB function to avoid USB stick malware attacks.

• **SD Write Protection:** Provides a mechanism for disabling SD write permission both in the filesystem SD and extended storage SD. (Note: Extended storage SD is only supported by the UC-8112-LX).
